

FIRING CABLES

Twisted firing cable in black and brown, both with a section of 0.75mm² are available in varying lengths. Our robust drum is made of steel and butyl rubber with a durable black finish.

FRONT OF DRUM

The front of each drum is fitted with two safety sockets (4 mm female) for connecting the exploder to the line.

A two clip safety lead plug is also supplied for connecting to the two safety sockets.

A shunt is supplied with the drum and can be connected to the sockets if the user wishes.

BACK OF DRUM

The black knob located on the back of the drum is used to tighten the drum's brake. Turning in the clockwise direction tightens the brake, while turning in the anti-clockwise direction releases the brake.

Warning: make sure that the brake is not tightened before attempting to roll or unroll the firing line.
